

Comments on Global Warming is BENEFICIAL

From 1938 to 2008, (70 year) period, earth's population doubled from (3) Billion to (6) Billion people.. In another (70) year period, (if nothing is done to mitigate the rising birth rate), the population will swell to (12) Billion people .

Yet again, one more (70) year period., (subject to population control), could see the population exploding to (24) Billion people, with a commensurate increase of live-stock and agricultural needs.

ALL the aforementioned need water ! !

(70%) of the Earth's (FRESH-WATER) has been SAVED for mankind in the ANARCTICA, in the forms off ice and snow! Rarely, does the temperature there exceed freezing (-32 F),

Hopefully, the current global-warming trend WILL continue till most, if NOT all the ice & snow has been converted to fresh water, thereby returning to the Earth's climatic system.

Man's use of oil HAS contributed to the acidification of the Oceans. The melting of the ice & snow, will help to restore the PH of the oceans. It was more alkaline, (before man's polluting), via the excess CO 2, created and saved, in the structure of the oceans' waters .

Note:

By the end of the [2nd] (70 year) period, approx (2148), oil reserves will be severely diminished, if NOT exhausted. Then, electricity generated from renewable energy resources and/or Atomic fission will do the following:

- 1) Desalinate water from the Oceans.
- 2) Supply plenty of good drinking-water.
- 3) Transfer the desalinated (fresh-water), to areas where it is needed/desired
- 4) Supply fresh water for irrigational uses, in marginally wet areas.
- 5) Create large fresh-water lakes, for multiple uses.
- 6) Help to reduce the height of the Oceans, caused by the melting of land ice.
- 7) Grow food hydroponically, to augment food produced on land.
- 8) Using electricity, create (synthesize), (for Eons), ALL the water needed.

After 2148, scientists will have to cope with curtailing population growth ... or colonizing other planets, or something else ! ? !
